

## FEATURES

**Nonreflective, 50 Ω design**

**High isolation: 45 dB typical at 2 GHz**

**Low insertion loss: 0.6 dB at 2 GHz**

**High power handling**

33 dBm through path

27 dBm terminated path

**High linearity**

1 dB compression (P1dB): 35 dBm typical

Input third-order intercept (IIP3): 58 dBm typical

**ESD rating: 2 kV human body model (HBM), Class 2**

**Single positive supply: 3.3 V to 5.0 V**

**Standard TTL-, CMOS-, and 1.8 V-compatible control**

**16-lead, 3 mm × 3 mm LFCSP package (9 mm<sup>2</sup>)**

**Pin compatible with the [HMC241ALP3E](#)**

## APPLICATIONS

Cellular/4G infrastructure

Wireless infrastructure

Automotive telematics

Mobile radios

Test equipment

## GENERAL DESCRIPTION

The [HMC7992](#) is a general-purpose, nonreflective, 0.1 GHz to 6.0 GHz, silicon, single-pole, four-throw (SP4T) switch in a leadless, surface-mount package. The switch is ideal for cellular infrastructure applications, offers high isolation of 45 dB typical at 2 GHz, and a low insertion loss of 0.6 dB at 2 GHz. It offers excellent power handling capability up to 6.0 GHz, with input power of 1 dB compression point (P1dB) of 35 dBm at 5 V operation. The [HMC7992](#) has good low frequency input power handling below 0.1 GHz and can operate well down to 10 kHz, with a typical 1 dB compression of 21 dBm (see Figure 21) and an IIP3 of 37 dBm (see Figure 22) at 1 MHz.

## FUNCTIONAL BLOCK DIAGRAM

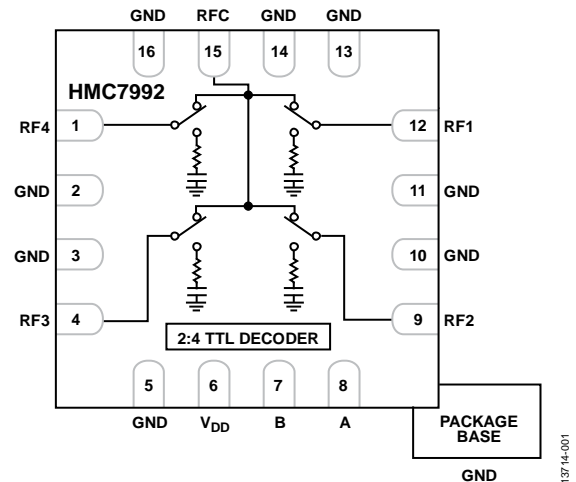

Figure 1.

The on-chip circuitry allows the [HMC7992](#) to operate at a single, positive supply voltage range from 3.3 V to 5 V, and as well as a single, positive control voltage from 0 V to 1.8 V/3.3 V/5.0 V. A 2:4 decoder integrated in the switch requires only two controlled input signals, with a positive control voltage range from 0 V to 1.8 V/3.3 V/5.0 V, to select one of the four radio frequency (RF) paths.

$V_{DD} = 5 V$			0.18	0.23	mA

# ABSOLUTE MAXIMUM RATINGS

Table 4.

Parameter	Rating
Bias Voltage Range ( $V_{DD}$ )	-0.3 V to +5.5 V
Control Voltage Range (A, B)	-0.5 V to $V_{DD} + (+0.5 V)$
RF Input Power, <sup>1</sup> 3.3 V to 5 V (see Figure 2 and Figure 3)	
Through Path	34 dBm
Terminated Path	28 dBm
Hot Switching	30 dBm
Channel Temperature	135°C
Storage Temperature Range	-65°C to +150°C
Maximum Peak Reflow Temperature (MSL3)	260°C
Thermal Resistance (Channel to Package Bottom)	
Through Path	115°C
Terminated Path	200°C
ESD Sensitivity	
Human Body Model (HBM)	2 kV (Class 2)
Charged Device Model (CDM)	1.25 kV

<sup>1</sup> For recommended operating conditions, see Table 1.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

## ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

NOTES  
 1. THE EXPOSED PAD MUST CONNECT TO RF/DC GROUND.

Figure 4. Pin Configuration

Table 5. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	RF4	RF Port 4. This pin is dc-coupled and matched to 50 Ω. A dc blocking capacitor is required on this pin.
2, 3, 5, 10, 11, 13, 14, 16	GND	Ground. The package bottom has an exposed metal pad that must connect to the printed circuit board (PCB) RF/dc ground. See Figure 5 for the GND interface schematic.
4	RF3	RF Port 3. This pin is dc-coupled and matched to 50 Ω. A dc blocking capacitor is required on this pin.
6	V <sub>DD</sub>	Supply Voltage.
7	B	Logic Control Input B. See Figure 6 for the control input interface schematic. See Table 6 and the recommended input control voltages range in Table 2.
8	A	Logic Control Input A. See Figure 6 for the control input interface schematic. See Table 6 and the recommended input control voltages range in Table 2.
9	RF2	RF Port 2. This pin is dc-coupled and matched to 50 Ω. A dc blocking capacitor is required on this pin.
12	RF1	RF Port 1. This pin is dc-coupled and matched to 50 Ω. A dc blocking capacitor is required on this pin.
15	RFC	RF Common Port. This pin is dc-coupled and matched to 50 Ω. A dc blocking capacitor is required on this pin.
	EPAD	Exposed Pad. The exposed pad must connect to RF/dc ground.

## THEORY OF OPERATION

The HMC7992 requires a single positive supply voltage applied to the  $V_{DD}$  pin. A bypassing capacitor is recommended on the supply line to minimize RF coupling.

The HMC7992 integrates with an internal 2:4 decoder; the four RF paths are selected via the two digital control voltages applied to the A and B control inputs. A small value bypassing capacitor is recommended on these digital signal lines to improve the RF signal isolation.

The HMC7992 is internally matched to  $50\ \Omega$  at the RF common port (RFC) and the RF ports (RF1, RF2, RF3, and RF4); therefore, no external matching components are required. The RF pins are dc-coupled and dc blocking capacitors are required on the RF paths. The design is bidirectional; the RF input signals can apply at the RFC port or the RF1 to RF4 ports. The inputs and outputs are interchangeable.

Depending on the logic level applied to the control input pins, A and B, one RF output port (for example, RF1) is set to on mode, by which an insertion loss path is provided from the input to the output. The other RF output ports (for example, RF2, RF3, and RF4) are then set to off mode, by which the outputs are isolated from the input. When the RF output ports (RF1, RF2, RF3, and RF4) are in isolation mode, they are internally terminated to  $50\ \Omega$ , and thereby can absorb the applied RF signal.

The ideal power-up sequence is as follows:

1. Power up GND.
2. Power up  $V_{DD}$ .
3. Power up the digital control inputs. The relative order of the logic control inputs is not important. Powering the logic control inputs before the  $V_{DD}$  supply can inadvertently forward bias and damage the internal ESD protection structures.
4. Apply the RF input.

**Table 7. Switch Mode Operation**

Digital Control Inputs		Signal Mode
A	B	RFC to RFx
Low	Low	RF Port 1 is in on mode, providing a low insertion loss path from the RFC port to the RF1 port. The remaining RF ports (RF2, RF3, and RF4) are in off mode; they are isolated from the RFC port and internally terminated to a $50\ \Omega$ load.
High	Low	RF Port 2 is in on mode, providing a low insertion loss path from the RFC port to the RF2 port. The remaining RF ports (RF1, RF3, and RF4) are in off mode; they are isolated from the RFC port and internally terminated to a $50\ \Omega$ load.
Low	High	RF Port 3 is in on mode, providing a low insertion loss path from the RFC port to the RF3 port. The remaining RF ports (RF1, RF2, and RF4) are in off mode; they are isolated from the RFC port and internally terminated to a $50\ \Omega$ load.
High	High	RF Port 4 is in on mode, providing a low insertion loss path from the RFC port to the RF4 port. The remaining RF ports (RF1, RF2, and RF3) are in off mode; they are isolated from the RFC port and internally terminated to a $50\ \Omega$ load.

### APPLICATIONS INFORMATION

Generate the evaluation PCB with proper RF circuit design techniques. Signal lines at the RF port must have a 50 Ω impedance, and the package ground leads and backside ground slug must connect directly to the ground plane, as shown in Figure 23. The evaluation board shown in Figure 23 is available from Analog Devices, Inc., upon request.
