

HFA1100

850MHz, Low Distortion Current Feedback Operational Amplifiers

FN2945
Rev.9.00
October 26, 2004

The HFA1100 is a high-speed, wideband, fast settling current feedback amplifier built with Intersil's proprietary complementary bipolar UHF-1 process. It operates with single supply voltages as low as 4.5V (see Application Information section).

The HFA1100 is a basic op amp with uncommitted pins 1, 5, and 8.

This device offers a significant performance improvement over the AD811, AD9617/18, the CLC400-409, and the EL2070, EL2073, EL2030.

Ordering Information

PART NUMBER (BRAND)	TEMP. RANGE (°C)	PACKAGE	PKG. DWG. #
HFA1100IP	-40 to 85	8 Ld PDIP	E8.3
HFA1100IB (H1100I)	-40 to 85	8 Ld SOIC	M8.15
HFA1100IB96 (H1100I)	-40 to 85	8 Ld SOIC Tape and Reel	M8.15
HFA1100IBZ (Note) (H1100I)	-40 to 85	8 Ld SOIC (Pb-free)	M8.15
HFA1100IBZ96 (Note) (H1100I)	-40 to 85	8 Ld SOIC Tape and Reel (Pb-free)	M8.15
HFA11XXEVAL	DIP Evaluation Board for High-Speed Op Amps		

NOTE: Intersil Pb-free products employ special Pb-free material sets; molding compounds/die attach materials and 100% matte tin plate termination finish, which are RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020C.

The Op Amps with Fastest Edges

Features

- Low Distortion (30MHz, HD2) -56dBc
- -3dB Bandwidth 850MHz
- Very Fast Slew Rate 2300V/μs
- Fast Settling Time (0.1%) 11ns
- Excellent Gain Flatness
 - (100MHz) ±0.14dB
 - (50MHz) ±0.04dB
- High Output Current 60mA
- Overdrive Recovery <10ns
- Operates with 5V Single Supply (See AN9745)
- Pb-Free Available (RoHS Compliant)

Applications

- Video Switching and Routing
- Pulse and Video Amplifiers
- RF/IF Signal Processing
- Flash A/D Driver
- Medical Imaging Systems

Pinout

Absolute Maximum Ratings $T_A = 25^\circ\text{C}$

Voltage Between V_+ and V_-	12V
Input Voltage	V_{SUPPLY}
Differential Input Voltage	5V
Output Current (50% Duty Cycle)	60mA

Operating Conditions

Temperature Range	-40°C to 85°C
-------------------------	---

Thermal Information

Thermal Resistance (Typical, Note 1)	θ_{JA} ($^\circ\text{C}/\text{W}$)	θ_{JC} ($^\circ\text{C}/\text{W}$)
PDIP Package	130	N/A
SOIC Package	170	N/A
Maximum Junction Temperature (Plastic Package)	150°C	
Maximum Storage Temperature Range	-65°C to 150°C	
Maximum Lead Temperature (Soldering 10s)	300°C (SOIC - Lead Tips Only)	

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

NOTE:

- θ_{JA} is measured with the component mounted on an evaluation PC board in free air.

Electrical Specifications $V_{\text{SUPPLY}} = \pm 5\text{V}$, $A_V = +1$, $R_F = 510\Omega$, $R_L = 100\Omega$, Unless Otherwise Specified

Application Information

Optimum Feedback Resistor (R_F)

The enclosed plots of inverting and non-inverting frequency response detail the performance of the HFA1100 in various gains. Although the bandwidth dependency on A_{CL} isn't as severe as that of a voltage feedback amplifier, there is an appreciable decrease in bandwidth at higher gains. This decrease can be minimized by taking advantage of the current feedback amplifier's unique relationship between bandwidth and R_F . All current feedback amplifiers require a feedback resistor, even for unity gain applications, and the R_F , in conjunction with the internal compensation capacitor, sets the dominant pole of the frequency response. Thus, the amplifier's bandwidth is inversely proportional to R_F . The HFA1100 design is optimized for a 510 Ω R_F , at a gain of +1. Decreasing R_F in a unity gain application decreases stability, resulting in excessive peaking and overshoot (Note: Capacitive feedback causes the same problems due to the feedback impedance decrease at higher frequencies). At higher gains the amplifier is more stable, so R_F can be decreased in a trade-off of stability for bandwidth. The table below lists recommended R_F values for various gains, and the expected bandwidth.

A_{CL}	R_F (Ω)	BW (MHz)
+1	510	850
-1	430	580
+2	360	670
+5	150	520
+10	180	240
+19	270	125

5V Single Supply Operation

This amplifier operates at single supply voltages down to 4.5V. The table below details the amplifier's performance with a single 5V supply. The dramatic supply current reduction at this operating condition (refer also to Figure 23) makes these op amps even better choices for low power 5V systems. Refer to Application Note AN9745 for further information.

PARAMETER	TYP
Input Common Mode Range	1V to 4V
-3dB BW ($A_V = +2$)	267MHz
Gain Flatness (to 50MHz, $A_V = +2$)	0.05dB
Output Voltage ($A_V = -1$)	1.3V to 3.8V
Slew Rate ($A_V = +2$)	475V/ μ s
0.1% Settling Time	17ns
Supply Current	5.5mA

Use of Die in Hybrid Applications

This amplifier is designed with compensation to negate the package parasitics that typically lead to instabilities. As a result, the use of die in hybrid applications results in overcompensated performance due to lower parasitic capacitances. Reducing R_F below the recommended values for packaged units will solve the problem. For $A_V = +2$ the recommended starting point is 300 Ω , while unity gain applications should try 400 Ω .

PC Board Layout

The frequency performance of this amplifier depends a great deal on the amount of care taken in designing the PC board. **The use of low inductance components such as chip resistors and chip capacitors is strongly recommended, while a solid ground plane is a must!**

Attention should be given to decoupling the power supplies. A large value (10 μ F) tantalum in parallel with a small value chip (0.1 μ F) capacitor works well in most cases.

Terminated microstrip signal lines are recommended at the input and output of the device. Output capacitance, such as that resulting from an improperly terminated transmission line will degrade the frequency response of the amplifier and may cause oscillations. In most cases, the oscillation can be avoided by placing a resistor in series with the output.

Care must also be taken to minimize the capacitance to ground seen by the amplifier's inverting input. The larger this capacitance, the worse the gain peaking, resulting in pulse overshoot and possible instability. To this end, it is recommended that the ground plane be removed under traces connected to pin 2, and connections to pin 2 should be kept as short as possible.

An example of a good high frequency layout is the Evaluation Board shown below.

Evaluation Board

An evaluation board is available for the HFA1100 (Part Number HFA11XXEVAL). Please contact your local sales office for information.

The layout and schematic of the board are shown below:
