The ISL54226 is a single supply, dual SPST (Single Pole/Single Throw) switch that is configured as a DPST. It can operate from a single 2.7 V to 5.25 V supply. The part was designed for switching or isolating a USB high-speed source or a USB high-speed and full-speed source in portable battery powered products.

The $3.5 \Omega$ SPST switches were specifically designed to pass USB full speed and USB high-speed data signals. They have high bandwidth and low capacitance to pass USB high-speed data signals with minimal distortion.

The ISL54226 has OVP detection circuitry on the COM pins to open the SPST switches when the voltage at these pins exceeds 3.8 V or goes negative by -0.45 V . It isolates fault voltages up to +5.25 V or down to -5 V from getting passed to the other side of the switch, thereby protecting the USB downstream transceiver.

The OE/ALM logic pin is an open drain input/output that can be driven to open the switches or monitored to tell when the part is in an overvoltage state.
The part has an interrupt ( $\overline{\mathrm{INT})}$ output pin to indicate a 1 to 1 (high/high) state on the COM lines to inform the $\mu$ processor when entering a dedicated charging port mode of operation.

The ISL54226 is available in 8 Ld $1.2 \mathrm{~mm} \times 1.4 \mathrm{~mm} \mu$ TQFN and 8 Ld $2 \mathrm{~mm} \times 2 \mathrm{~mm}$ TDFN packages. It operates over a temperature range of -40 to $+85^{\circ} \mathrm{C}$.

## Features

- High-speed (480Mbps) and full-speed (12Mbps) signaling capability per USB 2.0
- 1.8 V logic compatible ( 2.7 V to +3.6 V supply)
- OE/ALM pin to open all switches and indicate overvoltage fault condition
- Charger interrupt indicator output
- Power OFF protection
- COM pins overvoltage protection for +5.25 V and -5 V fault voltages
- -3dB frequency . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 790MHz
- Low ON capacitance @ 240MHz. . . . . . . . . . . . . . . . . . . . . 2pF
- Low ON-resistance . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . $3.5 \Omega$
- Single supply operation (VDD). . . . . . . . . . . . . . 2.7V to 5.25 V
- Available in $\mu$ TQFN and TDFN packages
- Pb-Free (RoHS compliant)
- Compliant with USB 2.0 short circuit and overvoltage requirements without additional external components

## Applications

- MP3 and other personal media players
- Cellular/mobile phones, PDA's
- Digital cameras and camcorders
- USB switching

NOTES:
2. Please refer to TB347 for details on reel specifications.
3. These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and 100\% matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb -free soldering operations). Intersil Pb -free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
4. These Intersil Pb-free plastic packaged products employ special Pb-free material sets; molding compounds/die attach materials and NiPdAu plate - e4 termination finish, which is RoHS compliant and compatible with both SnPb and Pb -free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
5. For Moisture Sensitivity Level (MSL), please see device information page for ISL54226. For more information on MSL please see techbrief TB363.

## NOTES:

10. $\mathrm{V}_{\text {LOGIC }}=$ Input voltage to perform proper function.
11. The algebraic convention, whereby the most negative value is a minimum and the most positive a maximum, is used in this data sheet.
12. Parameters with MIN and/or MAX limits are $100 \%$ tested at $+25^{\circ} \mathrm{C}$, unless otherwise specified. Temperature limits established by characterization and are not production tested.
13. Flatness is defined as the difference between maximum and minimum value of ON -resistance over the specified analog signal range.
14. $r_{O N}$ matching between channels is calculated by subtracting the channel with the highest max $r_{O N}$ value from the channel with lowest max $r_{O N}$ value.
15. Limits established by characterization and are not production tested.

## Test Circuits and Waveforms

Logic input waveform is inverted for switches that have the opposite logic sense.

Repeat test for all switches. $C_{L}$ includes fixture and stray capacitance.

$$
v_{\text {OUT }}=v_{\text {(INPUT) }} \frac{R_{L}}{R_{L}+r_{\text {ON }}}
$$

## Application Block Diagram

## Detailed Description

The ISL54226 device is a dual single pole/single throw (SPST) analog switch configured as a DPST that operates from a single DC power supply in the range of 2.7 V to 5.25 V .

It was designed for switching a USB high-speed or full-speed source in portable battery powered products. It is offered in small $\mu$ TQFN and TDFN packages for use in MP3 players, cameras, PDAs, cellphones, and other personal media players.

The part consists of two $3.5 \Omega$ high-speed SPST switches. These switches have high bandwidth and low capacitance to pass USB high-speed (480Mbps) differential data signals with minimal edge and phase distortion. They can also swing from OV to 3.6 V to pass USB full speed (12Mbps) differential data signals with minimal distortion.

The part contains special overvoltage detection and protection (OVP) circuitry on the COM+ and COM- pins. This circuitry acts to open the USB in-line switches when the part senses a voltage on the COM pins that is $>3.8 \mathrm{~V}$ (typ) or $<-0.45 \mathrm{~V}$ (typ). It isolates voltages up to 5.25 V and down to -5 V from getting through to the other side of the switch to protect the USB transceiver connected at the D+ and D-pins.

The device has an open drain $O E / A L M$ pin that can be driven "Low" to open all switches. The OE/ALM pin gets internally pulled "Low" whenever the part senses an overvoltage condition. The pin must be externally pulled "High" with a $100 \mathrm{k} \Omega$ pull-up resistor and monitored for a "Low" to determine when an overvoltage condition has occurred.

The part has charger port interrupt detection circuitry (CP) on the COM pins that outputs a Low on the $\overline{\text { INT }}$ pin to inform the $\mu$ Controller or power management circuitry when entering a dedicated charging port mode of operation. The charger mode operation is initiated by driving the OE/ALM pin Low and externally connecting the COM pins together which pulls the COM lines High, triggering the $\overline{\text { INT }}$ pin to go Low and the SPST switches to open.

The ISL54226 was designed for MP3 players, cameras, cellphones, and other personal media player applications that need to switch a high-speed or full-speed transceiver source. A "Typical Application Block Diagram" of this functionality is shown on page 7.

A detailed description of the SPST switches is provided in the following section.

## High-Speed (Dx) SPST Switches

The Dx switches are bi-directional switches that can pass USB high-speed and USB full-speed signals when VDD is in the range of 2.7 V to 5.25 V .

When powered with a 2.7 V supply, these switches have a nominal $r_{O N}$ of $3.5 \Omega$ over the signal range of OV to 400 mV with a $r_{O N}$ flatness of $0.26 \Omega$. The $r_{O N}$ matching between the switches over this signal range is only $0.2 \Omega$, ensuring minimal impact by the switches to USB high-speed signal transitions. As the signal level increases, the ron switch resistance increases. At signal level of 3.3 V , the switch resistance is nominally $9.8 \Omega$.

See Figures 11, 12, 13, 14, 15, 16 in the "Typical Performance Curves" beginning on page 11.

The Dx switches were specifically designed to pass USB 2.0 high-speed ( 480 Mbps ) differential signals in the range of 0 V to 400 mV . They have low capacitance and high bandwidth to pass the USB high-speed signals with minimum edge and phase distortion to meet USB 2.0 high-speed signal quality specifications. See Figure 17 in the "Typical Performance Curves" on page 12 for USB High-speed Eye Pattern taken with switch in the signal path.

The Dx switches can also pass USB full-speed signals (12Mbps) in the range of OV to 3.6 V with minimal distortion and meet all the USB requirements for USB 2.0 full-speed signaling. See Figure 18 in the "Typical Performance Curves" on page 13 for USB Full-speed Eye Pattern taken with switch in the signal path.
The switches are active (turned ON) whenever the OE/ALMvoltage is logic " 1 " (High) and OFF when the OE/ALM voltage is logic "0" (Low).

## Overvoltage Protection (OVP)

The maximum normal operating signal range for the Dx switches is from OV to 3.6 V . For normal operation the signal voltage should not be allow to exceed these voltage levels or go below ground by more than -0.3 V .

However, in the event that a positive voltage $>3.8 \mathrm{~V}$ (typ) to 5.25 V , such as the USB $5 \mathrm{~V} \mathrm{~V}_{\text {BUS }}$ voltage, gets shorted to one or both of the COM+ and COM- pins or a negative voltage <-0.45V (typ) to -5 V gets shorted to one or both of the COM pins, the ISL54226 has OVP circuitry to detect the over voltage condition and open the SPST switches to prevent damage to the USB down-stream transceiver connected at the signal pins (D-, D+).

The OVP and power-off circuitry allows the COM pins (COM-, COM+) to be driven up to 5.25 V while the $\mathrm{V}_{\mathrm{DD}}$ supply voltage is in the range of OV to 5.25 V . In this condition the part draws $<100 \mu \mathrm{~A}$ of $\mathrm{I}_{\mathrm{COMx}}$ and $\mathrm{I}_{\mathrm{DD}}$ current and causes no stress to the IC. In addition the SPST switches are OFF and the fault voltage is isolated from the other side of the switch.

The OE/ALM pin gets internally pulled low whenever the part senses an overvoltage condition. The pin must be externally pulled "High" with a $100 \mathrm{k} \Omega$ pull-up resistor and monitored for a "Low" to determine when an overvoltage condition has occurred. This output can be monitored by a $\mu$ Controller to indicate a fault condition to the system.

## External VDD Series Resistor to Limit IDD Current during Negative OVP Condition

A $100 \Omega$ to $1 \mathrm{k} \Omega$ resistor in series with the VDD pin (see Figure 8) is required to limit the $I_{D D}$ current draw from the system power supply rail during a negative OVP fault event.

With a negative -5V fault voltage at both com pins, the graph in Figure 9 shows the $I_{D D}$ current draw for different external resistor values for supply voltages of $2.7 \mathrm{~V}, 3.6 \mathrm{~V}$, and 5.25 V . Note: With a $500 \Omega$ resistor the current draw is limited to around 5 mA . When the negative fault voltage is removed the I IDD current will return to it's normal operation current of $25 \mu \mathrm{~A}$ to $45 \mu \mathrm{~A}$.

The series resistor also provides improved ESD and latch-up immunity. During an overvoltage transient event (such as occurs during system level IEC 61000 ESD testing), substrate currents can be generated in the IC that can trigger parasitic SCR structures to turn ON, creating a low impedance path from the $\mathrm{V}_{\mathrm{DD}}$ power supply to ground. This will result in a significant amount of current flow in the IC, which can potentially create a latch-up state or permanently damage the IC. The external $\mathrm{V}_{\mathrm{DD}}$ resistor limits the current during this overstress situation and has been found to prevent latch-up or destructive damage for many overvoltage transient events.

Under normal operation the low microamp IDD current of the IC produces an insignificant voltage drop across the series resistor resulting in no impact to switch operation or performance.

FIGURE 8. $V_{\text {DD }}$ SERIES RESISTOR TO LIMIT IDD CURRENT DURING NEGATIVE OVP AND FOR ENHANCED ESD AND LATCHUP IMMUNITY

FIGURE 9. NEGATIVE OVP IDD CURRENT vs RESISTOR VALUE vs V SUPPLY

FIGURE 10. CHARGER PORT DETECTION

## CHARGER PORT DETECTION

The ISL54226 has special charger port detection circuitry that monitors the voltage at the com pins to detect when a battery charger has been connected into the USB port (see Figure 10).

When the battery charger is connected to the USB connector it shorts the COM+ and COM- pins together. The shorting of the pins is sensed by the ISL54226 IC and it pulls the COM+ and COMlines high and as long as the OE/ALM pin is driven low ( $O E / A L M=$ " 0 ") by the $\mu$ P, it will drive its INT logic output "Low" to tell the power management circuitry that a battery charger is connected at the port and not a USB host transceiver. The power management circuitry will then set the appropriate current level and use the USB connector VBUS line to charge the battery.

## ISL54226 Operation

The following will discuss using the ISL54226 shown in the "Application Block Diagram" on page 7.

## Power

The power supply connected at the VDD pin provides the DC bias voltage required by the ISL54226 part for proper operation. The ISL54226 can be operated with a $\mathrm{V}_{\mathrm{DD}}$ voltage in the range of 2.7 V to 5.25 V .

For lowest power consumption you should use the lowest VDD supply.

A $0.01 \mu \mathrm{~F}$ or $0.1 \mu \mathrm{~F}$ decoupling capacitor should be connected from the VDD pin to ground to filter out any power supply noise from entering the part. The capacitor should be located as close to the VDD pin as possible.

In a typical application, $\mathrm{V}_{\mathrm{DD}}$ will be in the range of 2.8 V to 4.3 V and will be connected to the battery or LDO of the portable media device.

## Logic Control

The state of the ISL54226 device is determined by the voltage at the $O E / A L M$ pin and the signal voltage at the COM pins. Refer to "Truth Table" on page 2.

The OE/ALM pin is internally pulled low through 4M $\Omega$ resistors to ground and can be tri-stated by a $\mu$ Processor.

The $O E / A L M$ pin is an open drain connection. It should be pulled high through an external 100k $\Omega$ pull-up resistor. The OE/ALM pin can then be driven "Low" by a $\mu$ Processor to open all switches or it can be monitored by the $\mu$ Processor for a "Low" when the part goes into an overvoltage condition.

The ISL54226 is designed to minimize IDD current consumption when the logic control voltage is lower than the $V_{D D}$ supply voltage. With $\mathrm{V}_{\mathrm{DD}}=3.6 \mathrm{~V}$ and the $0 \mathrm{E} / \mathrm{ALM}$ logic pin is at 1.4 V the part typically draws only $25 \mu \mathrm{~A}$. With $\mathrm{V}_{\mathrm{DD}}=4.3 \mathrm{~V}$ and the $0 \mathrm{E} / \mathrm{ALM}$ logic pin is at 2.6 V the part typically draws only $35 \mu \mathrm{~A}$. Driving the logic pin to the $V_{D D}$ supply rail minimizes power consumption.

The $O E / A L M$ pin can be driven with a voltage higher than the $V_{D D}$ supply voltage. It can be driven up to 5.25 V with a $\mathrm{V}_{\mathrm{DD}}$ supply in the range of 2.7 V to 5.25 V .

TABLE 2. LOGIC CONTROL VOLTAGE LEVELS

| V $V_{\text {DD }}$ SUPPLY RANGE | LOGIC = "0" (LOW) | LOGIC $=$ " 1 " (HIGH) |
| :---: | :---: | :---: |
| 2.7 V to 3.6V | OE/ALM <br> or <br> or <br> floating | OE/ALM |
| 3.7 V to 4.2 V | $\leq 0.7 \mathrm{~V}$ <br> or <br> floating | $\geq 1.4 \mathrm{~V}$ |
| 4.3 V to 5.25 V | $\leq 0.8 \mathrm{~V}$ <br> or <br> floating | $\geq 2.0 \mathrm{~V}$ |

## Normal Operation Mode

With a signal level in the range of OV to 3.6 V the switches will be ON when the OE/ALM pin = Logic " 1 " and will be OFF (high impedance) when the $O E / A L M$ pin $=$ Logic " 0 ".

## USB 2.0 VBUS Short Requirements

The USB specification in section 7.1.1 states a USB device must be able to withstand a $V_{B U S}$ short ( 4.4 V to 5.25 V ) or a -1 V short to the $\mathrm{D}+$ or D - signal lines when the device is either powered off or powered on for at least 24 hours.

The ISL54226 part has special power-off protection and OVP detection circuitry to meet these short circuit requirements. This circuitry allows the ISL54226 to provide protection to the USB down-stream transceiver connected at its signal pins (D-, D+) to meet the USB specification short circuit requirements.

The power-off protection and OVP circuitry allows the COM pins (COM-, COM+) to be driven up to 5.25 V or down to -5 V while the $\mathrm{V}_{\mathrm{DD}}$ supply voltage is in the range of 0 V to 5.25 V . In these overvoltage conditions with a $500 \Omega$ external VDD resistor the part draws $<55 \mu \mathrm{~A}$ of current into the COM pins and causes no stress/damage to the IC. In addition all switches are OFF and the shorted $\mathrm{V}_{\text {BUS }}$ voltage will be isolated from getting through to the other side of the switch channels, thereby protecting the USB transceiver.
