3. Specifications apply to MMIC die with two RF input and two RF output bond wires, and tested with 50 Ω GSG probes. Further performance tuning to optimize the RF input and RF output impedance matching is shown on Recommended Bonding Diagram and PCB Layout Detail (pg. 4). Typical performance curves are achieved by using the recommended bonding diagram and PCB layout detail.

Maximum Operating Ratings

Parameter	Rating
Input Power	+19 dBm
Junction Temperature ^{4,5}	+160°C
Operating Temperature	-40°C to +85°C

4. Operating at nominal conditions with T_C ≤ +160°C will ensure MTTF > 1 x 10⁶ hours.

5. Junction Temperature (T_J) = T_C + Θ_{JC} * ((V * I) - (P_{out} - P_{IN}))

Typical thermal resistance (Θ_{JC}) = 3.4°C/W.

a) For T_C = +25°C,

T_J = 108°C @ 6 V, 5.25 A, P_{OUT} = 38.5, P_{IN} = 17 dBm

b) For T_C = +80°C,

T_J = 159°C @ 6 V, 4.96 A, P_{OUT} = 38.1, P_{IN} = 17 dBm

Absolute Maximum Ratings^{6,7}

Parameter	Absolute Maximum
Input Power	+24 dBm
Drain Voltage	+6.5 V
Gate Voltage	-3 to 0 V
Junction Temperature ⁸	+175°C
Storage Temperature	-65°C to +150°C

6. Exceeding any one or combination of these limits may cause permanent damage to this device.

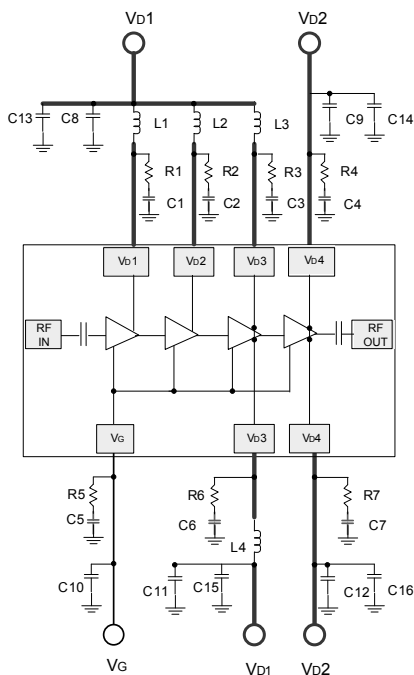

7. MACOM does not recommend sustained operation near these survivability limits.

8. Junction Temperature directly effects device MTTF. Junction temperature should be kept as low as possible to maximize lifetime.

Recommended Bonding Diagram and PCB Layout Detail:

For optimum power match, RF input and output microstrip lines require open stubs on the application board for bonding wire inductance compensation. Optimum bonding wire inductance for the RF I/O connection is 0.2 nH, and physical length for the gold bond wire (.001" dia.) is approximately 350 μm each for the two wire connection.

Application Information

The MAAP-011140 is designed to be easy to use yet high performance. The ultra small size and simple bias allows easy placement on system board. RF input and output ports are DC de-coupled internally.

Biasing conditions

Recommended biasing conditions are $V_D = 6$ V, $I_{DQ} = 3000$ mA (controlled with V_G). The drain bias voltage range, V_D , is 3 to 6.5 V, and the quiescent drain current biasing range, I_{DQ} , is 2000 to 4000 mA.

V_D bias must be applied to V_{D1} , V_{D2} , V_{D3} , and V_{D4} pads.

Both V_{D3} pads (6 and 14) are required for current symmetry.

Both V_{D4} pads (8 and 12), are required for current symmetry.

A single DC voltage (V_G) will bias all amplifier stages. Muting can be accomplished by setting the V_G to the pinched off voltage ($V_G = -2$ V).

Die Attachment

This product is manufactured from 0.050 mm (0.002") thick GaAs substrate and has vias through to the backside to enable grounding to the circuit.

Recommended conductive epoxy is Namics Unimec XH9890-6. Epoxy should be applied and cured in accordance with the manufacturer's specifications and should avoid contact with the top of the die.

Operating the MAAP-011140-DIE

Turn-on

1. Apply V_G (-1.5 V).
2. Apply V_D (6.0 V typical).
3. Set I_{DQ} by adjusting V_G more positive (typically $V_G \sim -0.9$ V for $I_{DQ} = 3000$ mA).
4. Apply RF_{IN} signal.

Turn-off

1. Remove RF_{IN} signal.
2. Decrease V_G to -1.5 V.
3. Decrease V_D to 0 V.
