TYPICAL APPLICATION CIRCUIT

1. C1, C2: Use ceramic capacitors (see table below); C3: For best performance, use a 100 μF or more capacitor.
2. C1, C2, & C3 are required and should be placed close to the pins of the converter, with shortest possible leads.
3. R1 is used when trimming down. R2 is used when trimming up.
4. No parallel connection or plug and play.

OUTPUT TRIMMING

Part Name	Vo nom	Trim Down	Trim Up
		R1(KΩ)	R2(KΩ)
V7803-500-SMT	3.3V	$= \frac{61 \cdot V_o - 75.10}{3.3 - V_o}$	$= \frac{75.10 - 10 \cdot V_o}{V_o - 3.3}$
V7805-500-SMT	5.0V	$= \frac{61 \cdot V_o - 91.52}{5.0 - V_o}$	$= \frac{91.52 - 10 \cdot V_o}{V_o - 5.0}$
V7812-500-SMT	12V	$= \frac{71 \cdot V_o - 287.02}{12 - V_o}$	$= \frac{287.02 - 20 \cdot V_o}{V_o - 12}$
V7815-500-SMT	15V	$= \frac{66 \cdot V_o - 269.37}{15 - V_o}$	$= \frac{269.37 - 15 \cdot V_o}{V_o - 15}$

To trim the output of the device input the desired output voltage (Vo) into the proper equation. R1 trims the output voltage down and R2 trims the voltage up. If not using the trim feature R1 and R2 are left open. Make sure that the desired output voltage is within the trim range.

SHUTDOWN CONTROL

The ON/OFF pin provides several features for adjusting and sequencing the power supply, a user has the flexibility of using the ON/OFF pin as:

- 1) A digital on/off control by pulling down the ON/OFF pin with an open-drain transistor.

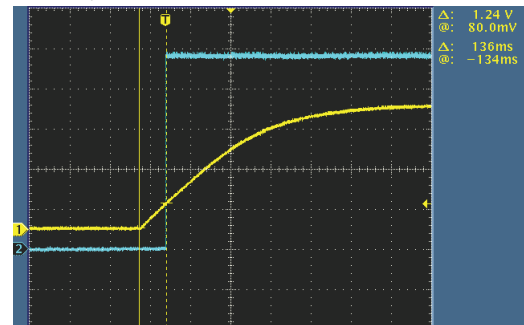

- 2) Line UVLO. If desired to achieve a UVLO voltage, a resistor divider from Vin to ON/OFF to GND can be used to disable the converter until a higher input voltage is achieved. For example, it is not useful for a converter with 12V output to start up with a 12V input, as the output cannot each regulation. To enable the converter when the input voltage reaches 14V, a 51kΩ/5kΩ voltage divider from Vin to GND can be connected to the ON/OFF pin. Both the precision 1.25V threshold and 150mV hysteresis are multiplied by the resistor ratio, providing a proportional 12% hysteresis for any startup threshold. So, the turn off threshold would be between 12.3V to 15.7V.

- 3) Power supply sequencing. By connecting a small capacitor from ON/OFF to GND, the 2µA current source and 1.25V threshold can provide a stable and predictable delay between startup of multiple power supplies. For example, a startup delay of roughly 64mS is provided using 100nF, and roughly 136mS by using 200nF.
