SiGe BiCMOS INTEGRATED CIRCUIT

μPD5740T6N

LOW NOISE WIDEBAND AMPLIFIER IC WITH THROUGH FUNCTION

DESCRIPTION

The μPD5740T6N is a low noise wideband amplifier IC mainly designed for the portable digital TV application. This IC has achieved low noise figure and the wideband operation. The μPD5740T6N has an LNA pass-through function (bypass function) to prevent the degradation of the received signal quality at the strong electric field, and achieve the high reception sensitivity and low power consumption.

The package is a 6-pin plastic TSON (Thin Small Out-line Non-leaded) (T6N) suitable for surface mount.

This IC is manufactured using our latest SiGe BiCMOS process that shows superior high frequency characteristics.

NOTES ON CORRECT USE

(1) Observe precautions for handling because of electro-static sensitive devices.
(2) Form a ground pattern as widely as possible to minimize ground impedance (to prevent undesired oscillation). All the ground terminals must be connected together with wide ground pattern to decrease impedance difference.
(3) The bypass capacitor should be attached to V_{CC} line.
(4) Do not supply DC voltage to INPUT pin.
(5) Pin 5 (NC) should be connected to the ground pattern.
